David,

Attached are 8 of the 9 circuits we will be using in this model. The ninth model is one being co-developed with another performer and we haven't finished it up yet.

Looking at the models as they stand right now there are several things that I know will be changing:
1. Weather data hasn't been updated to use something specific to the locations of each circuit.
2. Outage events (vegetation and any others) are still being developed and haven't been implemented.
3. You can ignore/modify the recorders in these files for your own purposes.
4. Input voltages will be unique for each circuit (right now, we are testing using the pre-recorded values included in the model.

There will probably be other minor changes to the model as we continue to develop and improve it.

Trevor

Yes, I'd be interested in seeing the "current state" model.

Need a file transfer option? https://transfer.pcloud.com

We are also still working out several details of the model so that it supports specific features we need for the exercise. That being said, if you are interested in seeing it, let me know and we can get a copy to you in its current state.
